

PROJECT STATE HANDOFF DOCUMENT

[PLATFORM_NAME]

Last Updated: _____

Version: 1.0

Read this document FIRST before doing anything. Then read the Master Prompt and Technical Execution Prompt. Then continue from the NEXT TASK section.

⚡ QUICK CONTEXT FOR NEW AGENT

You are continuing work on [PLATFORM_NAME] — a modern CMS + SaaS + SEO Tools ecosystem platform. You are acting as a Technical Co-Founder + Principal Engineer.

Before doing ANYTHING:

1. Read this entire document
2. Read Master_AI_CoFounder_System_Prompt_v3.md
3. Read Technical_Execution_Coding_Prompt_v1.md
4. Then continue from the NEXT TASK section below

DO NOT re-ask questions already answered here
DO NOT re-architect things already decided here
DO NOT contradict decisions logged in the DECISIONS LOG

📋 CURRENT STATUS

Field	Value
Phase	Phase 1 — Foundation
Status	☐ Not Started ☐ In Progress ☐ Complete
Last Updated	YYYY-MM-DD
Last Worked On	[Brief description of last task]

Field	Value
Next Task	[Exactly what to build next — be specific]
Blocking	[Any blockers or open questions — or None]

✓ COMPLETED WORK

Update this list after every session. Be specific — include file paths.

Phase 1 — Foundation

- ☐ Mono-repo folder structure created
- ☐ Docker Compose setup (all services)
- ☐ Django project initialized
- ☐ Django settings split (base / dev / prod / test)
- ☐ PostgreSQL connected and tested
- ☐ Redis connected and tested
- ☐ Wagtail CMS installed and configured
- ☐ Custom BaseModel created (apps/core/models.py)
- ☐ User model extended (apps/users/models.py)
- ☐ JWT auth configured (djanogetramework-simplejwt)
- ☐ RBAC roles defined (apps/users/roles.py)
- ☐ Next.js project initialized
- ☐ TailwindCSS configured with design tokens
- ☐ globals.css design tokens written
- ☐ tailwind.config.ts token mapping complete
- ☐ Base layout components (Header, Footer, Nav)
- ☐ Wagtail blog app created (apps/blog/)
- ☐ Blog index + detail page models
- ☐ SEO fields added (meta title, description, OG image)
- ☐ Sitemap + RSS feed configured
- ☐ Meilisearch connected
- ☐ MinIO connected
- ☐ Celery + Celery Beat configured
- ☐ Nginx config written
- ☐ GitHub Actions CI/CD pipeline
- ☐ .env.example file created
- ☐ README.md written
- ☐ architecture.md written

Phase 2 — Tools, Commerce & Dashboards

- ☐ Tools app created (apps/tools/)
- ☐ Downloads app created (apps/downloads/)
- ☐ MinIO file delivery configured
- ☐ Stripe payments integrated
- ☐ Resource Hub app created (apps/resources/)
- ☐ User dashboard pages (Next.js)
- ☐ Subscription plans + Stripe billing
- ☐ Lead capture forms + email integration

Phase 3 — AI, Automation & Monetization

- ☐ AI app created (apps/ai/)
- ☐ Ollama client configured
- ☐ LiteLLM abstraction layer
- ☐ AI content generation pipeline
- ☐ Analytics layer (PostHog/Umami)
- ☐ Programmatic SEO pages
- ☐ API key system + usage metering
- ☐ Semantic search (Meilisearch + embeddings)

Phase 4 — Enterprise & Marketplace

- ☐ Multi-tenancy architecture
- ☐ Plugin SDK
- ☐ White-label system
- ☐ SSO (SAML/OIDC)
- ☐ Enterprise billing

☐ CURRENT FOLDER STRUCTURE

Update this as files are created. [] = pending, [x] = done.

DECISIONS LOG

Every architectural or technical decision MUST be logged here. Format: Date | Decision | Reason | Impact

Date	Decision	Reason	Impact
—	Alpine.js added to frontend	Lightweight interactivity for CMS — no React overhead	All Wagtail templates use Alpine.js
—	MinIO over raw S3	Self-hosted, S3-compatible, no vendor lock-in	All file storage through MinIO client
—	Ollama as default AI inference	Open-source, self-hostable, no API costs	LiteLLM used as abstraction layer
—	UUID primary keys on all models	Avoids enumeration attacks, supports distributed systems	BaseModel uses UUIDField
—	JWT: httpOnly cookie (refresh) + Auth header (access)	Security best practice	Frontend handles token refresh
—	Redis DBs: 0=cache, 1=broker, 2=results	Clean separation of Redis usage	Celery and cache don't share DB

Date	Decision	Reason	Impact
—	Design tokens as CSS custom properties	Brand palette TBD — one-file global swap	All code uses var(--token), never hardcoded hex
—	Brand colors [TO_BE_DECIDED]	Palette not yet chosen	No brand colors in codebase until confirmed
—	Coolify for deployment	Self-hosted, open-source, no platform lock-in	Docker + Coolify deployment configs

❑ KNOWN ISSUES / TECHNICAL DEBT

ID	Description	Severity	File/Location	Resolution Plan
—	None yet	—	—	—

❑ KEY CONFIGURATION

Django Version:	5.x
Python Version:	3.12+
Next.js Version:	14+ (App Router)
Node Version:	20+
PostgreSQL Version:	16+
Wagtail Version:	6.x
Redis Version:	7+
Repo Structure:	Mono-repo (backend/ + frontend/ + docs/)
Git Branch:	main (protected) → develop → feature branches
CI/CD:	GitHub Actions
Deployment:	Coolify (self-hosted Docker)
API URL (dev):	http://localhost:8000/api/v1/
Frontend (dev):	http://localhost:3000
Wagtail Admin:	http://localhost:8000/cms/

❑ OPEN QUESTIONS / PENDING DECISIONS

#	Question	Affects	Priority
1	Brand name — what is [PLATFORM_NAME]?	All branding, domain, email	High
2	Brand color palette — which palette?	Entire frontend design system	High
3	Icon library — Heroicons or Lucide?	All UI components	Medium

#	Question	Affects	Priority
4	Analytics — PostHog, Umami, or Plausible?	analytics app, Phase 3	Medium
5	Email provider — Resend, Mailpit, Postal?	leads app, transactional email	Medium
6	Payment currency / region defaults?	subscriptions app, Stripe config	Medium

□ NEXT TASK (MOST IMPORTANT SECTION)

This is what the new agent should pick up and build next. Fill this in at the end of EVERY session.

```

NEXT TASK: [Fill this in at end of every session]

Description:
  [What exactly needs to be built]

Files to create/modify:
  - path/to/file.py
  - path/to/component.tsx

Inputs available:
  [What data/models/APIs already exist that this uses]

Expected output:
  [What should exist when this task is complete]

Dependencies that must exist first:
  [List anything that must be done before this task]

Notes from last session:
  [Anything the previous agent tried, decided, or struggled with]
```

□ SESSION LOG

Most recent at the top. Add a row after every session.

Date	Agent Used	What Was Done	What Was Left
—	—	Project setup, all 3 prompts created, roadmap defined	Nothing built yet — Phase 1 not started

□ PROMPT FILES — THE 3-FILE SYSTEM

A new agent needs ALL THREE of these files to continue the project correctly.

File	Purpose	When to Use
Master_AI_CoFounder_System_Prompt_v3.md	Strategy, stack, design system, open-source policy, principles	Paste as System Prompt at start of every session
Technical_Execution_Coding_Prompt_v1.md	Coding standards, rules, folder structure, output format	Paste after Master Prompt as context
PROJECT_STATE.md (this file)	Current progress, decisions, next task, what's built	Paste last — this tells the agent exactly where you are

How to Start a New Session with Any AI Agent

5. Paste Master_AI_CoFounder_System_Prompt_v3.md as the system prompt (or first message)
6. Paste Technical_Execution_Coding_Prompt_v1.md as the next message
7. Paste this PROJECT_STATE.md as the next message
8. Say: "Continue from the NEXT TASK section in the PROJECT_STATE document"
9. The agent has full context and can continue immediately

How to End a Session

10. Ask the agent: "Update the PROJECT_STATE.md with what was completed today"
11. Agent fills in: completed checklist items, new decisions, updated folder structure, NEXT TASK
12. Save the updated PROJECT_STATE.md
13. Next session starts with the updated file — zero context loss

This 3-file system works with: Claude, GPT-4, Gemini, Cursor, Windsurf, Copilot, or any AI agent that accepts system prompts or context files.

Keep this document up to date.

It is the memory of the project.

A new agent with all 3 files can continue immediately — zero context loss.
